APICS CPIM Learning System

The activities and techniques of maintaining the desired levels of items, whether raw materials, work in process, or finished products. Syn.: material control.	Inventory used to protect the throughput of an operation or the schedule against the negative effects caused by delays in delivery, quality problems, delivery of an incorrect quantity, and so on. Syn.: inventory cushion. See: fluctuation inventory, safety stock.
The branch of business management concerned with planning and controlling inventories.	The dollars that are in all levels of inventory.
Inventory that results whenever quantity price discounts, shipping costs, setup costs, or similar considerations make it more economical to purchase or produce in larger lots than are needed for immediate purposes.	A statement of a company's goals and approach to the management of inventories.
Inventory items that have met the obsolescence criteria established by the organization. For example, inventory that has been superseded by a new model or otherwise made obsolescent. [It] will never be used or sold at full value. Disposing of the inventory may reduce a company's profit.	Items used in support of general operations and maintenance such as maintenance supplies, spare parts, and consumables used in the manufacturing process and supporting operations.

Purchased items or extracted materials that are converted via the manufacturing process into components and products.	Inventory in the transportation network and the distribution system, including the flow through intermediate stocking points. The flow time through the pipeline has a major effect on the amount of inventory required in the pipeline. Time factors involve order transmission, order processing, scheduling, shipping, transportation, receiving, stocking, review time, and so forth. Syn.: pipeline inventory. See: distribution system, transportation inventory.
1) In general, a quantity of stock planned to be in inventory to protect against fluctuations in demand or supply. 2) In the context of master production scheduling, the additional inventory and capacity planned as protection against forecast errors and short-term changes in the backlog. Overplanning can be used to create [this]. Syn.: buffer stock, reserve stock. See: hedge, inventory buffer.	Reprocessing to salvage a defective item or part.
Inventory built up to smooth production in anticipation of a peak seasonal demand. Syn.: seasonal stock.	Material outside of specifications and possessing characteristics that make rework impractical.
Those modules, components, and elements that are planned to be used without modification to replace an original part. Syn.: repair parts, spare parts.	Products that have been stored in an uncompleted state and are awaiting final operations that will adapt them to different uses or customer specifications.

APICS CPIM Learning System

1) An inventory item. For example, a shirt in six colors and five sizes represents 30 [of these]. 2) In a distribution system, an item at a particular geographic The amount of time an item may be held in inventory location. For example, one product stocked at the plant before it becomes unusable. and at six different distribution centers would represent seven [of these]. Inventory that is in transit between locations. See: Inventory [moving] between manufacturing and pipeline stock, transit inventory. stocking locations. See: transportation inventory. A good or goods in various stages of completion throughout the plant, including all material from raw material that has been released for initial processing An inventory management technique in which material up to completely processed material awaiting final enters a plant and is processed through the plant into inspection and acceptance as finished goods finished goods without ever having entered a formal inventory. Many accounting systems also include the stock area. Syn.: four-wall inventory. value of semifinished stock and components in this category. Syn.: in-process inventory.

A cost accounting system that accumulates costs based on activities performed and then uses cost drivers to allocate these costs to products or other bases such as customers, markets, or projects. It attempts to allocate overhead costs on a more realistic basis than by using direct labor or machine hours. Syn.: activity-based costing, [...]. See: absorption costing.

An approach to inventory valuation in which variable costs and a portion of fixed costs are assigned to each unit of production. The fixed costs are usually allocated to units of output on the basis of direct labor hours, machine hours, or material costs. Syn.: allocation costing. See: activity-based costing.

APICS CPIM Learning System

The costs that increase as the number of orders placed increases. Used in calculating order quantities. Includes costs related to the clerical work of preparing, releasing, monitoring, and receiving orders; the physical handling of goods; inspections; and setup costs, as applicable. See: acquisition cost, inventory costs.

A method of costing used in batch manufacturing environments when the products produced have both common and distinguishing characteristics; for example, suits. The products are identified and costed by batches or by production runs, based on the variations.

An accounting/financial term (balance sheet classification of accounts) representing the residual claim by the company's owners or shareholders, or both, to the company's assets less its liabilities. See: assets, balance sheet, liabilities.

The costs incurred in the operation of a business that cannot be directly related to the individual goods or services produced. These costs, such as light, heat, supervision, and maintenance, are grouped in several pools (e.g., [department, factory, general]) and distributed to units of goods or services by some standard allocation method such as direct labor hours, direct labor dollars, or direct materials dollars. Syn.: burden. See: expense.

Cost allocated by some method to the products being produced. Initially recorded in asset (inventory) accounts, [this becomes] an expense (cost of sales) when the product is sold.

A cost accounting system in which the costs are collected by time period and averaged over all the units produced during the period. This system can be used with either actual or standard costs in the manufacture of a large number of identical units.

A method often associated with the management of inventory risk. Manufacturers and retailers that experience high variability in demand for their products can pool together common inventory components associated with a broad family of products to buffer the overall burden of having to deploy inventory for each discrete product.

1) The difference between the sales and cost of goods sold for an organization, sometimes expressed as a percentage of sales. 2) [In traditional accounting for a product, this] is the product selling price minus the direct material, direct labor, and allocated overhead for the product, sometimes expressed as a percentage of selling price.

<b>Term</b> Fixed order quantity			
APICS CPIM Learning System	© 2024		

An inventory valuation method in which only variable production costs are applied to the product; fixed factory overhead is not assigned to the product. Traditionally, variable production costs are direct labor, direct material, and variable overhead costs. [This] can be helpful for internal management analysis but is not widely accepted for external financial reporting. For inventory order quantity purposes, however, the unit costs must include both the variable and allocated fixed costs to be compatible with the other terms in the order quantity formula. For make-or-buy decisions, [this] should be used rather than full absorption costing. Syn.: direct costing.

1) In accounting, the addition of direct labor, direct material, and allocated overhead assigned at an operation. It is the cost roll-up as a part goes through a manufacturing process to finished inventory. 2) In current manufacturing terms, the actual increase of utility from the viewpoint of the customer as a part is transformed from raw material to finished inventory; the contribution made by an operation or a plant to the final usefulness and value of a product, as seen by the customer. The objective is to eliminate all non-value-added activities in producing and providing a good or service.

- 1) The rate of change of an item with respect to time. See: inventory turnover, lead time. 2) In supply chain management, a term used to indicate the relative speed of all transactions, collectively, within a supply chain community. [The maximum of this] is most desirable because it indicates higher asset turnover for stockholders and faster order-to-delivery response for customers.
- 1) The difference between the expected (budgeted or planned) value and the actual. 2) In statistics, a measurement of dispersion of data. See: estimate of error.

A term referring to the storage, transfer, and supply chain of temperature-controlled products. Industries in the cold chain include food and agriculture, pharmaceuticals, and chemicals.

1) Any activity that does not add value to the good or service in the eyes of the consumer. 2) A by-product of a process or task with unique characteristics requiring special management control. [The] production [of this] can usually be planned and somewhat controlled. Scrap is typically not planned and may result from the same production run as [this term]. See: hazardous waste.

A lot-sizing technique in MRP or inventory management that will always cause planned or actual orders to be generated for a predetermined fixed quantity, or multiples thereof, if net requirements for the period exceed [this].

A type of fixed order quantity model that determines the amount of an item to be purchased or manufactured at one time. The intent is to minimize the combined costs of acquiring and carrying inventory. [To calculate this find the square root of ((2AS)/(iC)) where A = annual usage in units, S = ordering costs in dollars, i = annual inventory carrying cost rate as a decimal, and C = unit cost.] Syn.: economic lot size, minimum cost order quantity. See: total cost curve.

APICS CPIM Learning System

Any material that a country's relevant government agency has classified as a risk to human, animal, or environmental health or to property—either on its own or due to interaction with other elements. A government's transportation authority may allow transportation only when proper permits and safety precautions are implemented. Similarly, a government may regulate or supervise hazardous material disposal. Categories include explosives, flammable or corrosive liquids or gasses, biohazards, and radioactive materials.

A form of independent demand management model in which an order is placed every n time units. The order quantity is variable and essentially replaces the items consumed during the current time period. If M is the maximum inventory desired at any time and x is the quantity on hand at the time the order is placed, then in the simplest model, the order quantity equals M minus x. The quantity M must be large enough to cover the maximum expected demand during the lead time plus a review interval. The order quantity model becomes more complicated whenever the replenishment lead time exceeds the review interval, because outstanding orders then have to be factored into the equation. Syn.: fixed-interval order system, fixed order quantity system, order level system, periodic review system, time-based order system. See: fixed reorder quantity inventory model, hybrid inventory system, independent demand item management models, optional replenishment

Inventory models for the replenishment of inventory. Independent demand inventory ordering models include fixed reorder cycle, fixed reorder quantity, optional replenishment, and hybrid models, among others. Dependent demand inventory ordering models include material requirements planning, kanban, and drum-buffer-rope.

Waste, such as chemicals or nuclear material, that is hazardous to humans or animals and requires special handling.

The amount of a particular item that is ordered from the plant or a supplier or issued as a standard quantity to the production process. Syn.: order quantity. A measure (usually expressed as a percentage) of satisfying demand through inventory or by the current production schedule in time to satisfy the customers' requested delivery dates and quantities. In a make-to-stock environment, [this] is sometimes calculated as the percentage of orders picked complete from stock upon receipt of the customer order, the percentage of line items picked complete, or the percentage of total dollar demand picked complete. In make-to-order and design-to-order environments, [it] is the percentage of times the customer-requested or acknowledged date was met by shipping complete product quantities. Syn.: measure of service, service level. See: cycle service level.

An item for reprocessing in the remanufacturing industry.

A lot-sizing technique that generates planned orders in quantities equal to the net requirements in each period. See: discrete order quantity.

Period order quantity

APICS CPIM Learning System

Average time for failure of a nonrepairable product The average time interval between failures for (expected life) or average time to first failure of a repairable product for a defined unit of measure (e.g., repairable product. See: reliability. operating hours, cycles, miles). See: reliability. A type of order point replenishment system where the minimum (min) is the order point, and the maximum (max) is the "order up to" inventory level. The order quantity is variable and is the result of the max minus The average time that it takes to repair a product. available and on-order inventory. An order is recommended when the sum of the available and onorder inventory is at or below the min. A set inventory level where, if the total stock on hand plus on order falls to or below that point, action is taken A measure (percentage) of meeting the customer's to replenish the stock. [It] is normally calculated as originally negotiated delivery request date. forecasted usage during the replenishment lead time Performance can be expressed as a percentage based plus safety stock. Syn.: reorder point, statistical order on the number of orders, line items, or dollar value point, trigger level. See: fixed reorder quantity inventory shipped on time. model. A lot-sizing technique under which the lot size is equal to the net requirements for a given number of periods An inventory replenishment system based on the stock (e.g., weeks into the future). The number of periods to on hand plus on order. Syn.: statistical order point order is variable, each order size equalizing the holding system. See: order point, reorder point, fixed reorder costs and the ordering costs for the interval. See: quantity inventory model, hybrid inventory system. discrete order quantity, dynamic lot sizing.

A method of aggregating requirements to place A computer record or manual document on which each deliveries of varying quantities at evenly spaced time inventory transaction is posted so that a current record intervals rather than variably spaced deliveries of equal of the inventory is maintained. quantities. 1) In a fixed [type of this] system of inventory control, the fixed quantity that should be ordered each time the The relief of inventory and computation of sales data at available stock (on-hand plus on-order) falls to or below the time and place of sale, generally through the use of the reorder point. 2) In a variable [type of this] system, bar coding or magnetic media and equipment. the amount ordered from time period to time period varies. Syn.: replenishment order quantity. A document that is part of the materials information system and accompanies the product. Formerly referred to as the manufacturing safety data sheet (MSDS). The document is prepared by the The total period of time that elapses from the moment manufacturer and provides information regarding the it is determined that a product should be reordered safety and chemical properties to downstream users until the product is back on the shelf available for use. and (if necessary) the long-term storage, handling, and Syn.: reorder cycle. disposal of the product. Among other factors, the SDS describes: the hazardous components of a product; how to treat leaks, spills, and fires; and how to treat improper human contact with the product.

A quantity-versus-time graphic representation of the order point/order quantity inventory system showing inventory being received and then used up and reordered.

An element of time added to normal lead time to protect against fluctuations in lead time so that an order can be completed before its real need date. When used, the MRP system, in offsetting for lead time, will plan both order release and order completion for earlier dates than it would otherwise. Syn.: protection time, safety time.

APICS CPIM Learning System

APICS CPIM Learning System

A measure of the effectiveness with which a company responds to actual demand or requirements. The stockout percentage can be a comparison of total orders containing a stockout with total orders or of line A document that represents the terms of performance items incurring stockouts with total line items ordered for organic support. during a period. One formula is stockout percentage = (1 – customer service ratio) × 100 percent. Ant.: customer service ratio. A type of fixed-order system in which inventory is carried in two [containers]. A replenishment quantity is ordered when the first [container] (working) is empty. During the replenishment lead time, material is used from the second A simple inventory control system where the inventory [container]. When the material is received, the second reordering is based on actually looking at the amount [container] (which contains a quantity to cover demand of inventory on hand. Usually used for low-value items, during lead time plus some safety stock) is refilled and the excess is put into the working [container]. At this time, stock such as nuts and bolts. See: two-bin inventory system. is drawn from the first [container] until it is again exhausted. Also used loosely to describe any fixed-order system even when physical [containers] do not exist. Syn.: bin reserve system. See: visual review system. A continuously growing list of records, called blocks, which are linked and secured using cryptography. Each block typically contains a cryptographic hash of An electronic data interchange (EDI) notification of the previous block, a timestamp, and transaction data. shipment of product. The data in any given block cannot be altered retroactively without the alteration of all subsequent blocks, inherently making it resistant to modification. A certificate that attests that the goods were A document attesting to a shipment's country of origin. manufactured in the exporter's country. It is provided and signed by the exporter's chamber of commerce.

An inventory accuracy audit technique where inventory is counted on a cyclic schedule rather than once a year. A cycle inventory count is usually taken on a regular, defined basis (often more frequently for high-value or fast-moving items and less frequently for low-value or A procedure for synchronizing cycle counting and slow-moving items). [the most effective of these] transaction processing. systems require the counting of a certain number of items every workday with each item counted at a prescribed frequency. The key purpose of [this] is to identify items in error, thus triggering research, identification, and elimination of the cause of the errors. A shipping term which indicates at what point The use of computer and telecommunication respective obligations, costs, and risk involved in the technologies to conduct business via electronic delivery of goods shift from the seller to the buyer. transfer of data and documents. When the on-hand quantity is within an allowed tolerance of the recorded balance. This important metric usually is measured as the percent of items with A series of pre-defined commercial terms published by inventory levels that fall within tolerance. Target values the International Chamber of Commerce relating to usually are 95 percent to 99 percent, depending on the international commercial law. These terms do not cover value of the item. For logistical operations (location property rights. management) purposes, it is sometimes measured as the number of storage locations with errors divided by the total number of storage locations. Reductions of actual quantities of items in stock, in A change made to an inventory record to correct the process, or in transit. The loss may be caused by balance in order to bring it in line with actual physical

scrap, theft, deterioration, evaporation, and so forth.

Sometimes referred to as shrinkage.

balance in order to bring it in line with actual physical inventory balances. The adjustment either increases or decreases the item record on-hand balance.
